

Ratings Prediction Project

Submitted by:
ARGHA KR MAITI

ACKNOWLEDGMENT

I would like to express my thanks of gratitude to mentors Swati Mahaseth as well as Flip Robo who gave me the golden opportunity to do this wonderful project on the topic Rating Prediction Project, which also helped me in doing a lot of research and I came to know about so many new things. I am really very thankful to them.

I am making this project to increase my knowledge.

INTRODUCTION

Problem Statement:

We have a client who has a website where people write different reviews for technical products. Now they are adding a new feature to their website i.e. The reviewer will have to add stars(rating) as well with the review. The rating is out 5 stars and it only has 5 options available 1 star, 2 stars, 3 stars, 4 stars, 5 stars. Now they want to predict ratings for the reviews which were written in the past and they don't have a rating. So, we have to build an application which can predict the rating by seeing the review.

This project consists on of 2 phases:

Data Collection Phase

We need to scrape the reviews of different laptops, Phones, Headphones, smart watches, Professional Cameras, Printers, Monitors, Home theater, Router from different e-commerce websites. Basically, we need these columns -

- 1) reviews of the product.
- 2) rating of the product.

Model Building Phase

After collecting the data, you need to build a machine learning model. Before model building do all data pre-processing steps involving NLP. Try different models with different hyper parameters and select the best model.

Analytical Problem Framing

With the help of Selenium I have scrapped data from different websites like, Snapdeal, Flipkart and Amazon and used Pandas library to save the data in excel file. Just taking a glance on basic code for scrapping from different websites.

```
1 # Opening the homepage of Nykaa
2 url = "https://www.nykaa.com/"
3 driver.get(url)
4
5 time.sleep(2)
6
7 search_bar = driver.find_element_by_class_name("css-1p0hsio") # Locating searc_bar by id
8 search_bar.clear() # clearing search_bar
9 search_bar.send_keys('Headphones') # sending user input to search bar
10 search_bar.submit()
```

```
1 links1=[]
2 driver.execute_script("window.scrollTo(0,document.body.scrollHeight)")
3 time.sleep(2)
4 try:
5     for l in driver.find_elements_by_xpath('//div[@class="product-list-box card desktop-cart"]/a'):
6         links1.append(l.get_attribute('href'))
7         time.sleep(1)
8 except NoSuchElementException:
9     links1.append("-")
10    time.sleep(1)
```

```
1 len(links1)
```

```
1 Rating1=[]
2 Review1=[]
3 Review_title1=[]
4 for url in links1:
5     driver.get(url)
6     time.sleep(2)
7
8     try:
9         all_reviews = driver.find_element_by_xpath('//a[@class="all-review-btn"]')
10        a =all_reviews.get_attribute('href')
11        driver.get(a)
12
13        dropdown = driver.find_element_by_xpath('//*[@id="js-pd-scroll-start"]/div[1]/div[2]/section/div/div')
14        negative = driver.find_element_by_xpath('//*[@id="js-pd-scroll-start"]/div[1]/div[2]/section/div/div/span')
15        action= ActionChains(driver)
16        action.move_to_element(dropdown).move_to_element(negative).click().perform()
17
18        # Extracting stars
19        try:
20            rating = driver.find_elements_by_xpath('//div[@class="desc-section"]/div[1]/div[1]')
21            for r in rating:
22                Rating1.append(r.text)
23        except NoSuchElementException:
24            Rating1.append('-')
25
26        time.sleep(1)
27        # Extracting review
28        try:
29            review = driver.find_elements_by_xpath('//div[@class="review-details"]/section/p')
30            for r in review:
31                Review1.append(r.text)
32        except NoSuchElementException:
33            Review1.append('-')
34
35        time.sleep(1)
36        # Extracting review
37        try:
38            review_title = driver.find_elements_by_xpath('//div[@class="review-details"]/section/h4')
39            for r in review_title:
40                Review_title1.append(r.text)
41        except NoSuchElementException:
42            Review_title1.append('-')
43    except TimeoutException:
44        pass
45    except NoSuchElementException:
46        pass
```

Saving the scrapped data into a csv file:

```
1 # dictionary of lists
2 dict = {'Rating': Rating1, 'Review': Review1, 'Review_title': Review_title1}
3
4 df = pd.DataFrame(dict)
5
6 # saving the dataframe
7 df.to_csv('Nykaa.csv')
```

Snapdeal

```

29021 rows × 4 columns

```
1 data.columns
```

```
Index(['Unnamed: 0', 'Rating', 'Review', 'Review_title'], dtype='object')
```

Above is the list of columns in our database.

```
1 data.shape
```

```
(29021, 4)
```

Our database consists of 4 columns and 29021 rows.

```
1 data.dtypes
```

```
Unnamed: 0    int64
Rating        object
Review        object
Review_title  object
dtype: object
```

Our dataset consists of integer and object type of data.

```
1 #Unnamed: 0 is not required for further analysis hence we will drop the column
2 data.drop('Unnamed: 0',axis=1, inplace=True)
```

```
1 data.dropna(inplace=True)#dropped rows which consists of null values
```

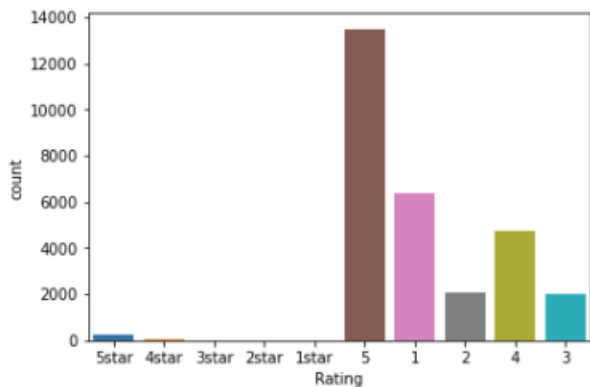

```
1 #lets check number of unique values in all columns
2 data.nunique()
```

```
Rating          10
Review         13350
Review_title    1672
dtype: int64
```

Our rating should only consist of 5 unique values i.e 1, 2, 3, 4, 5. let's have a look at rating column data with the help of countplot.

```
1 sns.countplot(data["Rating"])
```

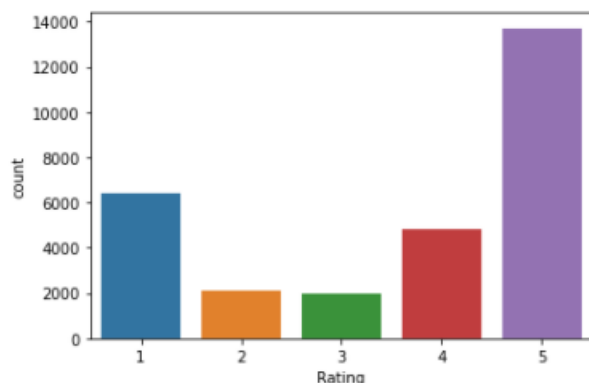

<matplotlib.axes._subplots.AxesSubplot at 0x23a33b1bf70>

```
1 data['Rating'] = data['Rating'].replace(['1star'],1, regex=True)#replacing 1star with 1
2 data['Rating'] = data['Rating'].replace(['2star'],2, regex=True)#replacing 2star with 2
3 data['Rating'] = data['Rating'].replace(['3star'],3, regex=True)#replacing 3star with 3
4 data['Rating'] = data['Rating'].replace(['4star'],4, regex=True)#replacing 4star with 4
5 data['Rating'] = data['Rating'].replace(['5star'],5, regex=True)#replacing 5star with 5
```

```
1 # reviewing rating column again
2 sns.countplot(data["Rating"])
```

<matplotlib.axes._subplots.AxesSubplot at 0x23a33d55580>

```
1 #lets look at counts of each values
2 data['Rating'].value_counts()
```

```
5    13709
1     6403
4     4802
2     2103
3     2003
Name: Rating, dtype: int64
```

```
1 data.shape
```

(29020, 3)

Let's do preprocessing of data with the help of NLP:

```
1 from nltk.corpus import stopwords
2 from nltk.tokenize import word_tokenize
3 import string
4 print("Stopwords :\n", stopwords.words("english"))
5 print("\n\n Punctuations :\n", string.punctuation)
```

Stopwords :

['i', 'me', 'my', 'myself', 'we', 'our', 'ours', 'ourselves', 'you', 'you're', 'you've', 'you'll', 'you'd', 'your', 'yours', 'yourself', 'yourselves', 'he', 'him', 'his', 'himself', 'she', 'she's', 'her', 'hers', 'herself', 'it', 'it's', 'its', 'itsel', 'f', 'they', 'them', 'their', 'theirs', 'themselves', 'what', 'which', 'who', 'whom', 'this', 'that', 'that'll', 'these', 'thos', 'e', 'am', 'is', 'are', 'was', 'were', 'be', 'been', 'being', 'have', 'has', 'had', 'having', 'do', 'does', 'did', 'doing', 'a', 'an', 'the', 'and', 'but', 'if', 'or', 'because', 'as', 'until', 'while', 'of', 'at', 'by', 'for', 'with', 'about', 'against', 'between', 'into', 'through', 'during', 'before', 'after', 'above', 'below', 'to', 'from', 'up', 'down', 'in', 'out', 'on', 'of', 'f', 'over', 'under', 'again', 'further', 'then', 'once', 'here', 'there', 'when', 'where', 'why', 'how', 'all', 'any', 'both', 'each', 'few', 'more', 'most', 'other', 'some', 'such', 'no', 'nor', 'not', 'only', 'own', 'same', 'so', 'than', 'too', 'very', 's', 't', 'can', 'will', 'just', 'don', 'don't', 'should', 'should've', 'now', 'd', 'll', 'm', 'o', 're', 've', 'y', 'ain', 'ar', 'en', 'aren't', 'couldn', 'couldn't', 'didn', 'didn't', 'doesn', 'doesn't', 'hadn', 'hadn't', 'hasn', 'hasn't', 'haven', 'have', 'n't', 'isn', 'isn't', 'ma', 'mightn', 'mightn't', 'mustn', 'mustn't', 'needn', 'needn't', 'shan', 'shan't', 'shouldn', 'should', 'n't', 'wasn', 'wasn't', 'weren', 'weren't', 'won', 'won't', 'wouldn', 'wouldn't']

Punctuations :

!"#\$%&'()*+,-./:;<=>?@[\]^_`{|}~

```
1 punct=string.punctuation
```

```
1 #function to remove punctuation
2 def remove_punctuation(txt):

```

```
0      earlier using apple ipod sound much good today got seriously ipod amazing sound quality bass eve...
1          mean price theyre really nice one good quality aesthetically pleasing sound quality good
2                                     perfect fitting nice sound quality awesome
3                                     decent product worth giving try
4          good colour girls nice voice liked price good
...
29016  press input mode change buttons speaker remote three options aux bluetooth fm option usb sd card...
29017  amazing product one thing lack bass control poor price range could given better features atleast...
29018  sound quality ok bass good buying bluetooth dont buy worst bluetooth quality range buy portable ...
29019  worst ever music system month 2 satellite audio jacks got bad carry service centres dont know ki...
29020  firstly ordered product wanted give friend gift new shop product delivered time woofer working r...
Name: Review, Length: 29020, dtype: object
```

Let's join all words in review column in a variable text:

```
1 text = " ".join(review for review in data['Review'])
2 print ("There are {} words in the combination of all review.".format(len(text)))
```

There are 1862925 words in the combination of all review.

```
1 stopwords_en = set(stopwords.words('english'))
```

Wordcloud

Word cloud of word in text variable:

```
1 # Create stopwords list:
2 stopwords = set(stopwords_en)
3
4 # Generate a word cloud image
5 wordcloud = WordCloud(stopwords=stopwords, background_color="white").generate(text)
6
7 # Display the generated image:
8 # the matplotlib way:
9 plt.figure(figsize=(10,8),facecolor='r')
10 plt.imshow(wordcloud, interpolation='bilinear')
11 plt.axis("off")
12 plt.show()
```

Above cloud gives us the most common words in entire reviews in bigfont size, word with smaller size is less used or less common.

```

1 #Getting sense of loud words in spam
2 from wordcloud import WordCloud
3
4
5 view = data['Review'][data['Rating']==1]
6
7 spam_cloud = WordCloud(width=700,height=500,background_color='white',max_words=20).generate(' '.join(view))
8
9 plt.figure(figsize=(10,8),facecolor='r')
10 plt.imshow(spam_cloud)
11 plt.axis('off')
12 plt.tight_layout(pad=0)
13 plt.show()

```

```

```

```
1 RSV5.score(x_train,y_train)
```

```
0.8775586620069895
```

Hyper parameter tuning with RandomForestClassifier gives us 87.76% accuracy.

Considering RandomForestClassifier with RandomizedSearchCV as final model for saving model.

Saving model:

```
1 import joblib
2 joblib.dump(RSV5,"RSVRPP.obj")
```

```
['RSVRPP.obj']
```

```
1 RSVfile=joblib.load("RSVRPP.obj")
2 RSVfile.predict(x_test)
```

```
array([5, 2, 5, ..., 1, 1, 4], dtype=int64)
```

CONCLUSION

In the Ratings Prediction Project, I have extracted ratings and reviews from different websites then saved the extracted csv file into one excel sheet. Our dataset mainly consists of 3 columns and 29021 rows. Columns are Rating, Review and Review title though we have one more column named Unnamed: 0 however that is not required for further analysis.

Then I did some preprocessing like dropping null values and Our rating should only consist of 5 unique values i.e 1, 2, 3, 4, 5 and the rating column actually consists of 10 unique values hence I used the replace method. Then with the help of NLP I have removed punctuations, stopwords from Review and review title column. Then used a lemmatization method to change words with similar meaning to one common word. With the help of wordcloud I performed some visualization.

I have then used the Tfidf method to vectorise and transform data. Values in our target column have different value counts hence with the use of random under sampler data of target column came down to equal value count. Used 5 methods for model building then with the help of RandomizedSearchCV I have tried to improve accuracy. Finally, I decided to go ahead with the Random Forest Classifier and saved the model.
